What To Do If Your Mobile Phone Gets Wet

Getting your mobile phone wet can be a real nightmare; especially if you have something like a new iPhone. These types of accidents happen all the time; a common event is that people accidentally drop their phone in the toilet. Here are a few tips for how you can save your mobile phone if this happens. Obviously there can be no guarantee that these tips are going to work but they are definitely worth trying to see if they can help.

- Removing the battery is the first thing that you should do. The reason for this is to avoid a short circuit from happening because this can often happen with water being a conductor of electricity; by taking away the source of the power you can stop most of the damage.

- Another thing that should be removed very quickly is the SIM card especially if you want to save the contents on it. If you want to dry the card in the safest way possible you should use a dry towel. It may be the case that you will have to go to an expert to get your data back but sometimes there is absolutely nothing you can do about it.

- Give your phone a good shake to get rid of as much water as possible. It is better if you can get rid of as much of the water as you can. Using absorbable paper towels is a good way to get rid of the water.

- You could dry your phone off by placing it outside on a warm day but make sure that you don't place it in direct sunlight. This will hopefully ensure that you get most of the moisture out of the phone. Of course this is not something that is going to work in the middle of winter or on a rainy day.

- You may find that it takes weeks before your phone can be used again but sometimes the damage simply cannot be reversed and it won't work again.

[Blackberry storm 2 leather case](#) is something that lots of people in today's world utilise. These are sometimes used on products that utilise [SD cards](#). [32GB USB](#) is important to individuals that are into their gaming as well.
